3-Step Hyaluronic Layering

The Intraceuticals propriety 3-Step Hyaluronic Layering philosophy delivers optimal hydration results. By expertly layering varied weights of hyaluronic acid, Intraceuticals treatments and products deliver and lock in hydration and actives to the skin, leaving it noticeably hydrated with enhanced volume and more defined facial contour. Intraceuticals delivers the best version of your skin.

Hyaluronic Acid is a molecule that occurs naturally in the body. It acts as a lubricant throughout the body, including the skin. With age, the body's ability to create hyaluronic acid slows, resulting in dry, dull looking skin. Replenishing hyaluronic acid to the skin helps restore its youthful appearance.

Step 1: Revive

Low Weight Hyaluronic Acids (the smallest molecules) found in the Intraceuticals Treatment and Daily Serums deliver hydration and active ingredients to instantly revive the skin. This large deposit of hyaluronic acid is like a drink of water for the skin. This rehydrating step provides the most visible improvement to the skin.

Step 2: Replenish

Medium Weight Hyaluronic Acids found in the Intraceuticals Gel products replenish the hydration supply and help to hold hydration to the skin. This step helps to keep the skin hydrated and acts as a reservoir of water for the skin.

Step 3: Protect

High Weight Hyaluronic Acids found in Intraceuticals Cream products draw moisture from the air to bind hydration to the skin. This finishing step helps to seal in and protect the results of the first two layers by locking in hydration.
